EXPERIENCE

Software Engineer II at Datadog - Java, Golang, SQL, Trino

February 2024 – Present

Query Gateway

- Pioneered customer facing service that standardizes native Datadog SQL language across a variety of downstream execution engines in order to support recent organization wide initiatives.
- Developed custom SQL driver to convert SQL response types across gRPC and HTTP protocols requiring extensive sandbox and staging environment testing to ensure existing users receive consistent data and data types.
- Orchestrated zero-downtime migration of all the organization's customers to the new service through proper Kubernetes pod provisioning, operational runbooks, on-call monitoring, synthetics, and dashboards.
- Engineered an internal routing system for Trino traffic across downstream clusters allowing the organization to decommission the use of third party gateway service ([Trino Gateway by Starburst](#)) gaining better downstream visibility, reducing company cost, accessing granular routing rules, and improving incident response strategies.

Software Engineer I at Datadog - Python, Golang, Typescript, React, SQL

August 2022 – February 2024

Collaboration Integrations Team

- Streamlined notification jobs by redirecting traffic across various queue groups, enhancing organizational efficiency and significantly reducing impact of queue failures on notification delivery across production and government datacenters
- Pioneered the implementation of bidirectionality using gRPC and API services for our third party integrations to internal teams launching the release of an incident management Datadog product
- Defined the team's seamless pipeline process for deploying changes to services on latest deployment platform
- Configured Kafka clusters and established producers for writing third-party events to the organization's various topics
- Established the team's first own databases while defining permissions and Alembic schema migration procedures

Software Engineer Intern at Two Sigma - Java, SQL

June 2022 – August 2022

Application Infrastructure Reliability Team

- Spearheaded the development and management of a process control system, orchestrating processes across a network of colocated and non-colocated machines to seamlessly trigger trading algorithms
- Centralized the process control optimizing for efficiency by establishing SSH pools to the machines for faster executions
- Deployed databases across datacenters for swift location identification and efficient state management of processes

Software Engineer Intern at Datadog - Scala, Python, Spark

January 2022 – May 2022

Performance Team

- Aggregated CPU and RSS metrics across all cloud instances in Datadog via chronjobs uploading data into AWS S3 buckets
- Processed uploaded data in S3 to generate histogram metrics through Spark for future autoscaling infrastructure initiative

Software Engineer Intern at Capital One - Python, SQL

June 2021 – August 2021

Card Technology Advanced Engineering Team

- Designed overall system design for AWS RDS comparison to present across Card Technology Teams
- Implemented comparison-based algorithm to ensure consistency across numerous RDS databases through Flask
- Displayed visual models and graphs from reports produced by algorithm through use of Matplotlib and Pandas library

EDUCATION

University of Virginia - Charlottesville, VA

August 2018 – May 2022

Bachelor of Science, Computer Science and Mathematics

GPA: 3.74/4.0

SKILLS

Languages and Frameworks - Java, Python, Golang, C++, Scala, SQL, Typescript, React, PHP

Infrastructure - AWS, Kubernetes, Kafka, Apache Spark, Terraform

PROJECTS

Reservation Bot - Python, Typescript, React

August 2023 – Present

- Engineered backend orchestration, leveraging API routes found in the network to fetch and claim bookings for restaurants
- Implemented a queuing system to handle customer booking requests in order
- Enabled connection to AWS instances colocated with the Resy servers, facilitating request executions through chronjobs
- Plan to integrate Stripe payment system for secure transactions before allowing users access to the service
